Abstract

This template supports short-form journal submissions where authors need transparent sections for dataset provenance, reproducible analysis notes, and concise argument framing.

1 Introduction

Open repositories have made humanities evidence easier to inspect, but reproducible reporting remains inconsistent across venues. This manuscript structure emphasizes methods and data traceability without requiring custom classes.

2 Methods

- Corpus selection: source archives and time windows.
- Annotation protocol: coding rules and adjudication process.
- Analysis pipeline: tokenization, metadata joins, and validation.

3 Dataset Summary

Collection	Items	Date span
Oral history transcripts	1,280	1951–2004
Editorial essays	420	1989–2022
Policy memoranda	233	1997–2025

Table 1: Example corpus composition.

4 Results

Primary themes stabilize after the fourth annotation iteration, with inter-rater agreement improving from 0.71 to 0.84. Topic drift is concentrated in policy memoranda, suggesting stronger contextual volatility in administrative prose.

5 Conclusion

A lightweight structure can preserve methodological clarity while staying publisher-agnostic. Authors can adapt this skeleton to discipline-specific formatting at submission time.
